

AVOCADO

Recovery from Phytophthora

Dave Ingles, Hohora New Zealand

One of the trees treated with Mycorrcin that have pushed new foliage since treatment

Overview

- Trees have been showing signs of Phytophthora for 2 years
- The worst effected trees were heavily pruned
- Mycorrcin was used at the rate of 10lt/ha through irrigation sprinklers

Observations

The trees are still sick but are show signs of recovery

Because of the sprinkler spread the application rate is concentrated to the equivalent of 20lt/ha

Trees will be monitored over the next year.
